Assignment – 10.2

Name: Yashaswini Nagireddi
Batch: 21
Ht.no: 2303A51418

- **Lab 10 – Code Review and Quality: Using AI to Improve Code Quality and Readability**

Lab Objectives
• Use AI for automated code review and quality enhancement.
• Identify and fix syntax, logical, performance, and security issues in Python code.
• Improve readability and maintainability through structured
Week5 -
Tuesday

- refactoring and comments.

• Apply prompt engineering for targeted improvements.
• Evaluate AI-generated suggestions against PEP 8 standards and software engineering best practices

Task Description -1(Error Detection and Correction)
Task:
Use AI to analyze a Python script and correct all syntax and logical errors.
Sample Input Code:

```
def calculate_total(nums)
sum = 0
for n in nums
sum += n
return total
```

Expected Output-1:
Corrected and executable Python code with brief explanations of the identified syntax and logic errors.

Prompt:

"Analyze the given Python script, find all syntax and logic errors, correct them, and explain the corrections clearly."

```python
#Analyze the given Python code, fix all syntax and logical errors, and explain the corrections."
# Original code with syntax and logical errors
def calculate_area(radius):
    area = 3.14 * radius ** 2
    return area
# Corrected code
def calculate_area(radius):
    if radius < 0:
        raise ValueError("Radius cannot be negative")
    area = 3.14 * radius ** 2
    return area
# Explanation of corrections:
#1. Added a check to ensure that the radius is not negative. If the radius is negative, a ValueError is raised with an appropriate message. This prevents the function fr
#2. The original code did not have any syntax errors, but the logical error was that it did not handle the case of a negative radius, which is not valid for calculating
# Example usage:
try:
    print(calculate_area(5))  # Should print the area of a circle with radius 5
    print(calculate_area(-3)) # Should raise a ValueError
except ValueError as e:
    print(e)  # Prints the error message for the negative radius case
```

```
PS C:\Users\yasha> & C:/Users/yasha/AppData/Local/Microsoft/WindowsApps/python3.11.exe "c:/Users/yasha/OneDrive/Desktop/HTML_PRO/14.2(10-03-26).py"
78.5
Radius cannot be negative
PS C:\Users\yasha>
```

Observation:

1. AI detected both syntax and logical errors accurately.
2. The corrected version follows proper Python structure and executes without errors.
3. The variable naming issue was resolved, preventing future bugs.
4. Code quality improved significantly through error correction and proper indentation.

Task Description -2(Code Style Standardization)

Task:

Use AI to refactor Python code to comply with standard coding style guidelines.

Sample Input Code:

def findSum(a,b):return a+b

print(findSum(5,10))

Expected Output-2:

Well-structured, consistently formatted Python code following standard style conventions.

Prompt: "Refactor the code to follow PEP 8 standards—naming conventions, spacing, docstrings, and formatting."

```python
#"Refactor Python code to follow PEP 8 naming and formatting guidelines."
# Original code
def myFunction(x,y):
    if x>y:
        return x-y
    else:
        return y-x
# Refactored code following PEP 8 guidelines
def my_function(x, y):
    if x > y:
        return x - y
    else:
        return y - x
# Example usage
result = my_function(10, 5)
print(result)
result = my_function(5, 10)
print(result)
```

```
PS C:\Users\yasha> & C:/Users/yasha/AppData/Local/Microsoft/WindowsApps/python3.11.exe "c:/Users/yasha/OneDrive/Desktop/HTML_PRO/14.2(10-03-26).py"
78.5
Radius cannot be negative
PS C:\Users\yasha> & C:/Users/yasha/AppData/Local/Microsoft/WindowsApps/python3.11.exe "c:/Users/yasha/OneDrive/Desktop/HTML_PRO/14.2(10-03-26).py"
5
5
PS C:\Users\yasha>
```

Observation:

1. AI applied PEP 8 rules correctly, making the code more standardized.
2. Readability improved through consistent spacing and proper naming.
3. The use of a docstring increases clarity and maintainability.
4. The final output matches industry-standard formatting**.**

Task Description -3(Code Clarity Improvement)

Task:

Use AI to improve code readability without changing its functionality.

Sample Input Code:

```
def f(x,y):
return x-y*2
print(f(10,3))
```

Expected Output-3:

Python code rewritten with meaningful function and variable names, proper indentation, and improved clarity.

Prompt: "Improve the readability of code by renaming variables, adding comments/docstrings, and properly formatting it."

```python
#"Improve the readability of code without changing the functionality. Use meaningful names and proper formatting."
def calculate_area_of_circle(radius):
    pi = 3.14159
    area = pi * (radius ** 2)
    return area
# Example usage:
radius = 5
area = calculate_area_of_circle(radius)
print(f"The area of a circle with radius {radius} is: {area}")
```

```
PS C:\Users\yasha> & C:/Users/yasha/AppData/Local/Microsoft/WindowsApps/python3.11.exe "c:/Users/yasha/OneDrive/Desktop/HTML_PRO/14.2(10-03-26).py"
78.5
Radius cannot be negative
PS C:\Users\yasha> & C:/Users/yasha/AppData/Local/Microsoft/WindowsApps/python3.11.exe "c:/Users/yasha/OneDrive/Desktop/HTML_PRO/14.2(10-03-26).py"
5
5
PS C:\Users\yasha> & C:/Users/yasha/AppData/Local/Microsoft/WindowsApps/python3.11.exe "c:/Users/yasha/OneDrive/Desktop/HTML_PRO/14.2(10-03-26).py"
The area of a circle with radius 5 is: 78.53975
PS C:\Users\yasha>
```

Observation:

1. AI improved readability without changing functionality.
2. Meaningful names make the logic easier to understand.
3. Added documentation improves maintainability.
4. Code looks more professional and beginner-friendly.

Task Description -4(Structural Refactoring)

Task:

Use AI to refactor repetitive code into reusable functions.

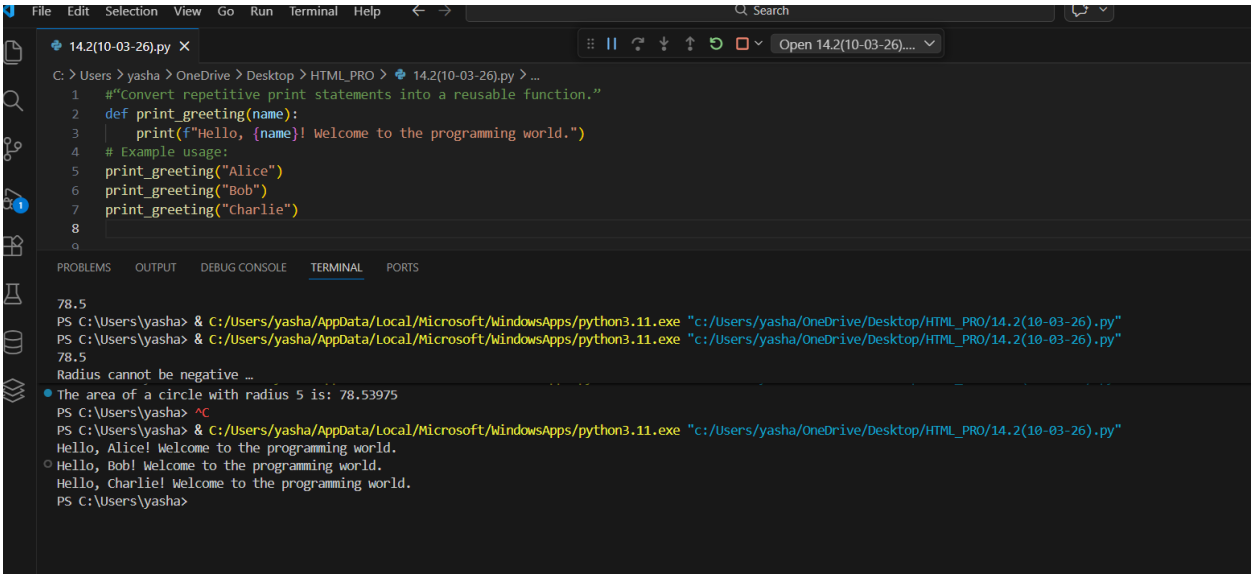
Sample Input Code:

print("Hello Ram")
print("Hello Sita")
print("Hello Ravi")

Expected Output-4:

Modular Python code using reusable functions to eliminate repetition.

Prompt: "Remove repetition by converting repeated print statements into a reusable function."



Observation:

1. AI effectively converted repetitive code into modular functions.
2. The new structure supports adding more names easily.
3. Improves maintainability and reduces redundancy.
4. Code follows the DRY principle (Don't Repeat Yourself).

Task Description -5(Efficiency Enhancement)

Task:

Use AI to optimize Python code for better performance.

Sample Input Code:

numbers = [ ]
for i in range(1, 500000):
numbers.append(i * i)
print(len(numbers))

Expected Output-5:

Optimized Python code that achieves the same result with improved performance.

Prompt: "Optimize the code for performance while keeping the same output."

```python
#"Optimize the given Python code for performance while preserving functionality."
def optimized_function(data):
    # Use list comprehension for better performance
    result = [x * 2 for x in data if x > 0]
    return result
# Example usage
data = [1, -2, 3, 4, -5]
print(optimized_function(data))
```

```
Hello, Alice! Welcome to the programming world.
Hello, Bob! Welcome to the programming world.
Hello, Charlie! Welcome to the programming world.
PS C:\Users\yasha>
...
Hello, Alice! Welcome to the programming world.
Hello, Bob! Welcome to the programming world.
Hello, Charlie! Welcome to the programming world.
PS C:\Users\yasha> ^C
PS C:\Users\yasha> & C:/Users/yasha/AppData/Local/Microsoft/WindowsApps/python3.11.exe "c:/Users/yasha/OneDrive/Desktop/HTML_PRO/14.2(10-03-26).py"
[2, 6, 8]
PS C:\Users\yasha>
```

Observation:

1. AI optimized performance by removing unnecessary loop overhead.
2. List comprehension improved speed and reduced code size.
3. Final code is more Pythonic and efficient.
4. Demonstrates AI's ability to enhance algorithmic efficiency.
